Exp 13: Case Study on Low-Code Limitations

Aim

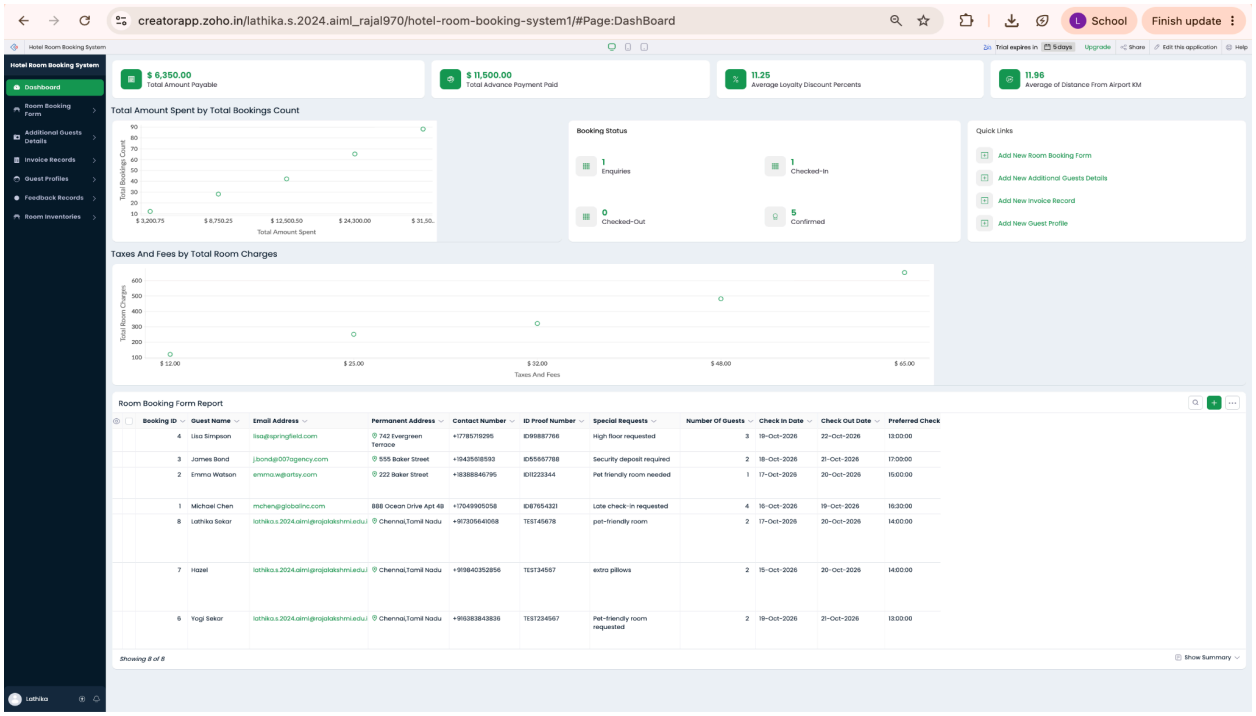

To study the limitations of low-code development platforms using the Hotel Room Booking System developed in Zoho Creator.

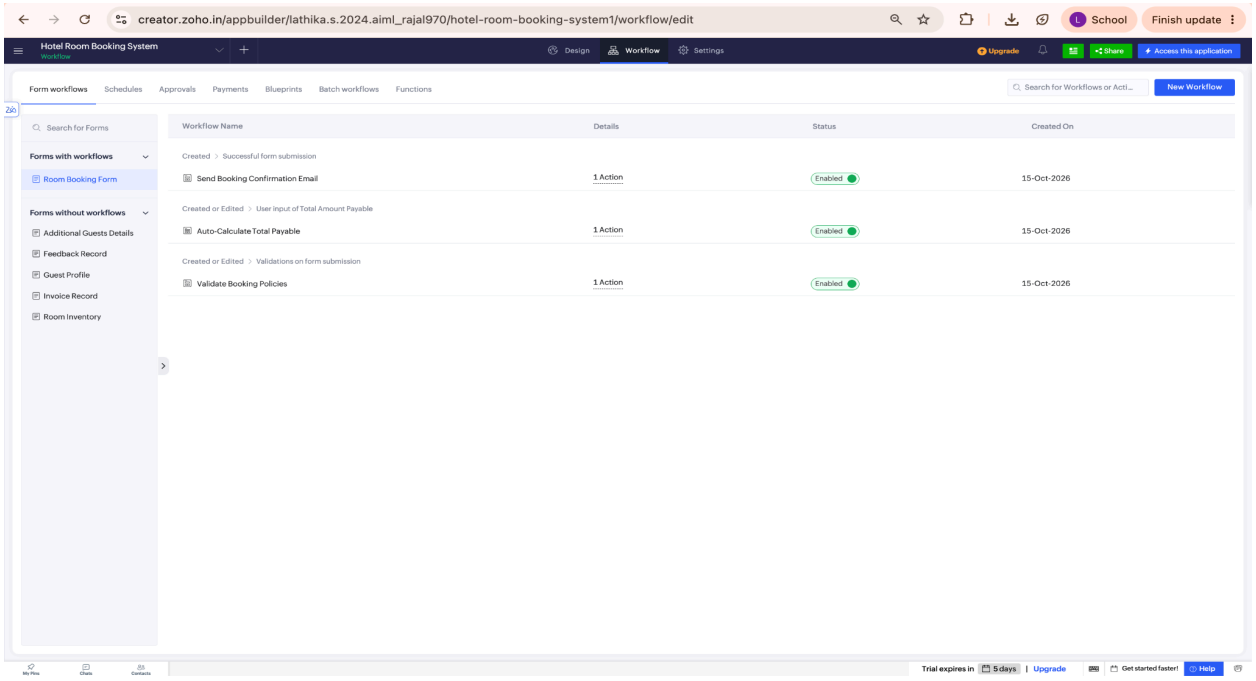

Procedure

1. Open the Hotel Room Booking System application in Zoho Creator.
2. Review the forms, reports, dashboards, and workflows created using the low-code platform.
3. Identify the advantages of using drag-and-drop components and built-in features for application development.
4. Examine the limitations of customizing complex business logic using the visual development interface.
5. Study the role of Deluge scripting for implementing custom validations, calculations, and workflow automation.
6. Review the challenges associated with API integration, application migration, and advanced customization.
7. Compare the ease of low-code development with the flexibility offered by traditional programming.
8. Document the findings and capture screenshots of the application components used in the case study.

Limitations Identified

1. Complex business logic may require additional Deluge scripting.
2. Advanced API integrations may require manual configuration and authentication.
3. Customization can be limited by the platform's available components and features.
4. Application migration may require additional configuration and verification.
5. Developers have less control over the underlying application infrastructure than with fully custom-coded solutions.

Result

The limitations of low-code development were studied using the Hotel Room Booking System, including challenges related to complex logic, API integration, customization, and application migration
